EVAN NARAYA HOKKY PRADYGTA

Backend & Integration Engineer
Magelang, Indonesia (UTC+7) | evannarayahp@gmail.com
linkedin.com/in/evannaraya | github.com/naraya07pedro-spec | evannaraya.netlify.app

SUMMARY

Backend and integration engineer, working in the field since 2026, building Python/FastAPI services on PostgreSQL. Focuses on how services behave when requests repeat or workers fail, and on testing those failure paths. Has built systems for two freelance clients and published four public engineering projects.

TECHNICAL SKILLS

Backend: Python, FastAPI, Pydantic, PostgreSQL, pgvector, TypeScript, REST APIs, pytest
Integration: webhooks, n8n, Supabase, MCP, Docker, GitHub CI
Reliability: authorization, durable state, idempotency, bounded retries, reconciliation, failure testing

EXPERIENCE

AI Automation & Integration Engineer (Independent) 2026 – Present
VAREVANT | Remote, Indonesia

- Build integration components that connect business workflows to APIs and PostgreSQL/Supabase.
- Added input validation, persistent workflow state, and idempotency controls so repeated requests do not repeat actions; built approval and recovery paths for actions with uncertain outcomes.
- Debugged partial updates, API contract mismatches, and failed VPS runs; maintained tests and handoff notes.

CLIENT PROJECTS (FREELANCE, PRIVATE WORK)

Freelance AI Automation & Integration Engineer, EZUmrah (Malaysia) 2026

- Designed and built an AI-integrated command center to coordinate operations for an Umrah travel business.
- Connected six workflows through shared orchestration, including API-dependent steps, and handled integration and testing.

Freelance AI Automation Engineer, PT Geget Gigit (Indonesia) 2026

- Built an AI-integrated system to coordinate marketing workflows and connect them to the company's frontend; handled workflow integration, testing, and iteration.

PUBLIC ENGINEERING PROJECTS

Reference implementations built to be tested; not customer deployments.

Bounded Agent Runtime | Python/FastAPI, PostgreSQL
Persisted approvals and worker ownership in PostgreSQL, added idempotency, and built recovery for external actions with uncertain outcomes. Archived v2: 261 tests, 90.01% coverage.
github.com/naraya07pedro-spec/agent-runtime-python

Production Integration Reference | TypeScript, PostgreSQL
Verified HMAC signatures on raw webhook bodies, reserved each event atomically to prevent duplicate processing, and retried failures a bounded number of times. Wrote tests for retries and failure paths.
github.com/naraya07pedro-spec/production-integration-reference

Knowledge Workflow Runtime | FastAPI, PostgreSQL/pgvector, MCP
Built versioned documents, source-cited retrieval, approval controls, and extraction. Historical: 134 tests, 91.64% coverage; 12/12 synthetic retrieval evaluations.
github.com/naraya07pedro-spec/varevant.com/tree/main/examples/agentic-systems-lab/knowledge-runtime

VAREVANT Workflow Engineering | n8n, JavaScript
Historical n8n export (117 nodes, 60 Code nodes): state checks, suppression, incident handling, recovery evidence.
github.com/naraya07pedro-spec/varevant.com/tree/main/n8n
