EVAN NARAYA HOKKY PRADYGTA

Automation & AI Implementation Engineer

n8n · API Integrations · Webhooks · Controlled AI Workflows · PostgreSQL

Magelang, Indonesia (UTC+7) · Open to remote roles

evannarayahp@gmail.com | LinkedIn | GitHub | Portfolio

PROFILE

Automation and AI implementation engineer building n8n workflows connected to APIs, webhooks and databases. Focused on safe execution through state checks, duplicate prevention, approval controls and failure recovery. Independent and freelance work since 2026.

TECHNICAL SKILLS

Automation & integration: n8n (VPS-hosted), REST APIs, webhooks, Gmail, Google Sheets, JavaScript, Supabase

AI & reliability: MCP, tool calling, cited retrieval, text validation, human approvals, suppression, idempotency, retries

Backend & delivery: Python/FastAPI, TypeScript, PostgreSQL, Docker, pytest, GitHub Actions, troubleshooting

EXPERIENCE

Independent AI Automation & Integration Engineer | VAREVANT | Remote, Indonesia | 2026–Present

• Built VPS-hosted n8n workflows for lead routing, follow-up dispatch, reply/bounce handling and database-backed workflow state.

• Implemented suppression, state re-checks and safe handling of uncertain sends; validated AI-generated copy with deterministic fallback. Documented and tested three workflow repairs.

FREELANCE CLIENT WORK (private implementations; source not public)

EZUmrah (Malaysia) | AI Automation & Integration | Built an AI-integrated operations command center connecting six workflows through shared orchestration, API-dependent steps and testing.

PT Geget Gigit (Indonesia) | AI Automation Engineering | Built an AI-assisted marketing workflow system integrated with its frontend; tested and iterated on connected processes.

SELECTED ENGINEERING PROJECTS (public references, not customer deployments)

VAREVANT Workflow Engineering | n8n, JavaScript

github.com/naraya07pedro-spec/varevant.com/tree/main/n8n

• Historical sanitized export with 117 nodes and 60 Code nodes. The 42-test offline suite checks synthetic workflow inputs, including routing, execution ownership and uncertain-send handling; five documented repair cases. Not a live client workload.

Production Integration Reference | TypeScript, PostgreSQL

github.com/naraya07pedro-spec/production-integration-reference

• Built signed webhook intake with raw-body HMAC verification, atomic event reservation and bounded retry classification. CI includes a 12-way concurrency test and signed end-to-end demonstration.

Full-Stack AI Operations Console | Next.js, Fastify, PostgreSQL

github.com/naraya07pedro-spec/fullstack-ai-operations-console

• Built an operator console with human approval before outbound requests, execution history and recoverable worker failures. Deterministic HTTP sandbox, not a live LLM or hosted backend. Verified CI: 58 native tests, 10 browser cases and 10 Docker smoke checks (13 Oct 2026).

Bounded Agent Runtime | FastAPI, PostgreSQL

github.com/naraya07pedro-spec/agent-runtime-python

• Implemented persistent approvals, tenant-scoped authorization and lease-fenced worker recovery for bounded agent actions. Archived v2: 261 tests, 90.01% coverage.

Additional: Knowledge Workflow Runtime — cited retrieval, document extraction and review states; historical 134 tests (7 Oct 2026).

All public project results are revision-specific engineering evidence, not customer performance claims.
