# EVAN NARAYA HOKKY PRADYGTA

## Backend & Integration Engineer

Python · FastAPI · PostgreSQL · TypeScript · REST APIs · Reliability

Magelang, Indonesia (UTC+7) · Open to remote roles

evannarayahp@gmail.com | LinkedIn | GitHub | Portfolio

### PROFILE

Backend and integration engineer building Python/FastAPI and TypeScript systems backed by PostgreSQL. Focused on authorization, duplicate requests, worker failures and recoverable external actions. Independent engineering and freelance client work since 2026, with public projects and reproducible tests.

### TECHNICAL SKILLS

**Backend & data:** Python, FastAPI, Pydantic, SQLAlchemy, Alembic, TypeScript, Fastify, Prisma, PostgreSQL, SQL

**APIs & reliability:** REST APIs, webhooks, HMAC, authorization, idempotency, worker leases, retries, reconciliation

**Testing & delivery:** pytest, Vitest, Playwright, concurrency/failure tests, Docker, GitHub Actions, Ruff, mypy

### EXPERIENCE

**Independent AI Automation & Integration Engineer | VAREVANT | Remote, Indonesia | 2026–Present**

• Built testable workflow control logic with database-backed state checks, execution ownership and reconciliation of uncertain external outcomes; verified by 42 offline tests.

• Integrated REST APIs, webhooks, Gmail, Google Sheets and PostgreSQL/Supabase. Diagnosed three documented n8n failure cases and added regression tests for each.

### FREELANCE CLIENT WORK (private implementations; source not public)

**EZUmrah (Malaysia)** | AI Automation & Integration | Built an AI-integrated operations command center connecting six workflows through shared orchestration, API-dependent steps and testing.

**PT Geget Gigit (Indonesia)** | AI Automation Engineering | Built an AI-assisted marketing workflow system integrated with its frontend; tested and iterated on connected processes.

### SELECTED ENGINEERING PROJECTS (public references, not customer deployments)

**Full-Stack AI Operations Console | Next.js, Fastify, PostgreSQL, Prisma**

github.com/naraya07pedro-spec/fullstack-ai-operations-console

• Built an authenticated workflow console with operator/viewer roles, versioned workflows and human approval before outbound actions. Added idempotent admission, leased workers, bounded retries and manual recovery. Deterministic HTTP sandbox, not a hosted backend or live LLM. Verified CI: 58 native tests, 10 browser cases and 10 Docker smoke checks (13 Oct 2026).

**Bounded Agent Runtime | Python/FastAPI, PostgreSQL**

github.com/naraya07pedro-spec/agent-runtime-python

• Persisted approval and dispatch intent before external tool calls; used lease fencing and bounded read-only reconciliation after worker failure rather than blind retries. Process-death and concurrency tests; archived v2: 261 tests, 90.01% coverage. Sandbox tools only.

**Production Integration Reference | TypeScript, PostgreSQL, webhooks**

github.com/naraya07pedro-spec/production-integration-reference

• Verified webhook HMAC signatures on raw bytes, reserved events atomically before side effects and classified retryable failures. Tested 12 concurrent contenders. Reference implementation; not exactly-once delivery.

**Knowledge Workflow Runtime | FastAPI, pgvector, MCP, OCR**

github.com/naraya07pedro-spec/varevant.com/tree/main/examples/agentic-systems-lab/knowledge-runtime

• Built source-versioned document retrieval with citations, deletion handling and document extraction. Historical 7 Oct 2026 verification: 134 tests, 91.64% coverage, 12/12 synthetic retrieval evaluations; keyword-based by default.

All public project results are revision-specific engineering evidence, not customer performance claims.
