

EVAN NARAYA HOKKY PRADYGTA

Automation & Integration Engineer

Advanced n8n | Python/FastAPI | APIs | PostgreSQL/pgvector | AI Workflows
Magelang, Indonesia (UTC+7) | evannarayahp@gmail.com | LinkedIn | GitHub

PROFILE

Automation and integration engineer building stateful n8n, API and AI-assisted systems. Strongest in workflow architecture, Python/FastAPI, PostgreSQL, explicit state, approvals and failure recovery. Public engineering proof also covers retrieval lifecycle, native MCP and document processing with local OCR.

CORE STACK

n8n | Python/FastAPI | REST APIs | Webhooks | JavaScript/TypeScript | PostgreSQL/pgvector | MCP | Local OCR | GitHub CI/Docker

PROFESSIONAL EXPERIENCE

AI Automation & Integration Engineer | VAREVANT | 2026-Present | Remote, Indonesia

- Build and maintain VPS-hosted n8n systems across intake, routing, queue handoff, email actions, follow-up, reply/bounce handling, and database-backed workflow state.
- Implement validation and reliability controls including live-state checks, suppression, deduplication, claim/verify gates, bounded retries, ambiguous-outcome holds, and explicit recovery paths.
- Develop backend and integration components with Python/FastAPI, JavaScript/TypeScript, PostgreSQL/Supabase, REST APIs, webhooks, Gmail, and Google Sheets.
- Debug contract mismatches, stale state, lost execution context, configuration failures, and partial commits; convert repaired paths into regression tests, CI checks, and handoff documentation.

SELECTED CLIENT WORK

PT Geget Gigit (Indonesia) - AI Automation Engineer

Designed and implemented an AI-powered CMO automation system for recurring marketing operations, covering process mapping, orchestration logic, implementation, testing, and iteration.

EZUmrh (Malaysia) - AI Automation & Integration Engineer

Designed a six-workflow automation and integration system plus shared orchestration for an Umrah travel business, covering API-dependent processes, staged configuration, testing, and implementation handoff.

SELECTED ENGINEERING PROOF

Bounded Agent Runtime | Python/FastAPI, PostgreSQL | v2: 261 tests, 90.01% coverage

Stateful runtime with tenant authorization, worker fencing, persistent approvals, bounded reconciliation, crash recovery, observability, deterministic evals, and failure-injection tests.

Knowledge Workflow Runtime | FastAPI, pgvector, MCP, OCR | 134 tests

Atomic source update/delete, filtered retrieval, reranking and source citations; native MCP, independent approval, PDF/image/DOCX extraction, local OCR, review states and durable handoffs. 91.64% statement/branch coverage; 12/12 evals. Synthetic reference; lexical/extractive default.

Production Integration Reference | TypeScript, PostgreSQL, REST/Webhooks

Runnable reference for raw-byte HMAC, durable event identity, atomic SQL reservation, stable idempotency keys, classified retries, contention tests, and partial-failure handling.

VAREVANT Workflow Engineering | n8n, JavaScript, APIs | historical 117 nodes | 60 Code nodes

Historical n8n system plus incident/recovery evidence covering routing, suppression, live re-checks, failure contracts, worker context, and explicit no-send/uncertain-send paths.
